

Data Analysis on Poverty Rate in India

By Vanshita Dhami, SY IT B, 25419

Introduction

The objective of this data analysis and its report is to examine the distribution of people living in multi-dimensional poverty, with respect to the headcount of people and the change in the said headcount, along with the specific States and Union Territories and with the year the data was recorded.

DATA EXPLORATION

How The Data Was Collected

The dataset was collected from Open Government Data (OGD) Platform, India. It contains a summary of multi-dimensional poverty in India during two different periods, .i.e., 2013-2014 & 2023-2024.

Features Identified

The features identified for the analysis is the headcount for the year 2013–2014 of people who were in multi-dimensional poverty, the headcount for the year 2023–2024 of people who were in multi-dimensional poverty, both gathered with respect to their States and Union territories, and also showing the population that escaped multi-dimensional poverty.

Visualization

The visualization for this dataset was created using Power BI.

Modeling and Results

Using the Multi-Dimensional Poverty dataset, we can see that the dashboard was created to show the aggregate value of all the States, rather than an individual state or city. To show appropriate values and a dashboard, aggregate values of each year and state along with multiple charts were used. Slicers are added, if wanting to focus on a single state.

Graphs like, line charts show the aggregate headcount of both the years, 2013–2014 and 2023–2024, showing an overall reduction in Multi-Dimensional Poverty.

The Map shows all the states and bubbles with respect to its poverty rate; bigger the bubble, higher the poverty.

Scatter plot shows the count of people who have escaped multi-dimensional poverty with respect to its State and UT.

A Bar graph shows the ratio and change in the headcount based on the state and year.

Findings

It has been observed that there has been an increase in the headcount since the initial year of 2013-2014 to the recent year of 2023-2024. Even though there is an increase in the headcount, we can see that there is an overall downward trend in the number of people living in multi-dimensional poverty.

States and UT that are smaller in size and population have shown a greater reduction in the population living in multi-dimensional poverty as compared to larger states, which reflects that size and population, as the size and population matters in the effectiveness of policies implemented by the government.

It is also noted that the North-Eastern and Central states have higher rates of multi-dimensional poverty as compared to the Southern states.

Regardless of the size and population of the States and UT it is extremely clear that the policies implemented by the GOI are working, and the overall poverty rate of the country is going down.

Conclusion

It is quite clear that the policies implemented are working and are bringing the overall poverty rate of India down. While the national poverty level is going down, the policies are not working equally for multiple states. GOI should ensure greater focus on the states that are behind.
